

Umpqua Community College Technology Center

Roseburg, Oregon

Exterior Elevation

The 10,000 square foot Technology Center was constructed to provide increased opportunities for technology students and the Intel Corporation educational program offered at Umpqua Community College. This facility required tight budget constraints which were met by designing a building that closely resembled the existing college buildings but allowed for less expensive roof framing and materials. This building was built seven years after the Ford Family Center at a cost savings of 25% per square foot. The facility provides several technology labs, ample storage and administrative offices, along with a large training/meeting room.
